

# Vue Trivia App

Your assignment is to write a Trivia game using Vue and then open trivia db API.

Use the Vue CLI to generate a new Project.

## Team work!

Please work in teams of 2 for this assignment. Submission will be explained in the Moodle post.

## Generating questions:

Use the website: [https://opentdb.com/api\\_config.php](https://opentdb.com/api_config.php) to generate an API link for your questions.

Choose the difficulty, number of questions and category. You can set this up however you choose, I'd recommend 10 questions to start.

## Functionality

### Start Screen

Your app should start on a "Start Screen."

The user must click a button or anywhere on the screen to start playing.

### Questions

Once the game starts, the app must fetch the questions from the API setup in the previous step. The app must ONLY display ONE question at a time.

If it is multiple choice, have 4 buttons with each answer as the text. If it is a True/False question, only display 2 buttons, one for True and one for False.

Once a question is answered the app must move on to the next question. When all the questions have been answered the user must be presented with a screen that displays all the questions. This is the result screen.

### Result Screen

The result screen must contain the questions with the correct answers and the answers the user chose.

### Scoring

Each question should count 10 points. Count all the correctly answered questions and display the users score on the result screen.

You have total freedom with this assignment. Have fun and be creative!
